

ER DIAGRAM

User and Ride Relationship

A single user can create several ride bookings, while every ride belongs to only one user. The Ride table stores the UserID to connect each ride with its respective user. For example, one customer can reserve cabs many times on different occasions.

Ride and Driver Relationship

Many rides may be allocated to the same driver over time, but every ride is handled by only one driver. The DriverID in the Ride table records the assigned driver for each trip.

Driver and Vehicle Relationship

Normally, one driver operates one vehicle. In shift-based operations, the same vehicle may be shared by different drivers at different times. This relationship is maintained through the DriverID stored in the Vehicle table.
